Fault-plane readings, outcrop near Nyabihu.
I visited the outcrop again to take my own measurements of the offset layers.

Readings:
- The exposed crack runs roughly north-south.
- The visible offset face leans about 70 degrees from level.
- The upper block has moved sideways from the lower block by roughly the width of my hand.

Method:
- I used the direction of the outcrop face and a straight stick held against it.
- I did not enter or pry at the crack.

These readings are my own note for the second visit. The first report keeps its
own record; the two are not merged.
